HANFORD METEOROLOGICAL STATION Email | Print | Text

Real-Time Met Data from Around the Site

These tables show the most recent 15-minute poll from each of the remote stations. The wind speed is (mph), wind direction is in degrees from north from which the wind is blowing, (270 = west wind, 360 = north wind, etc.), temperatures are (degrees F), precipitation is (inches). The MAX's and MIN's shown are for that 15-minute period ending at the time shown. The data page will automatically reload every 5 minutes.

PhoneGap

- HTML, CSS, and JavaScript
- One code set covers 7 devices
- IOS, Android, Blackberry, WebOs, Windows Phone, Symbian, Bada

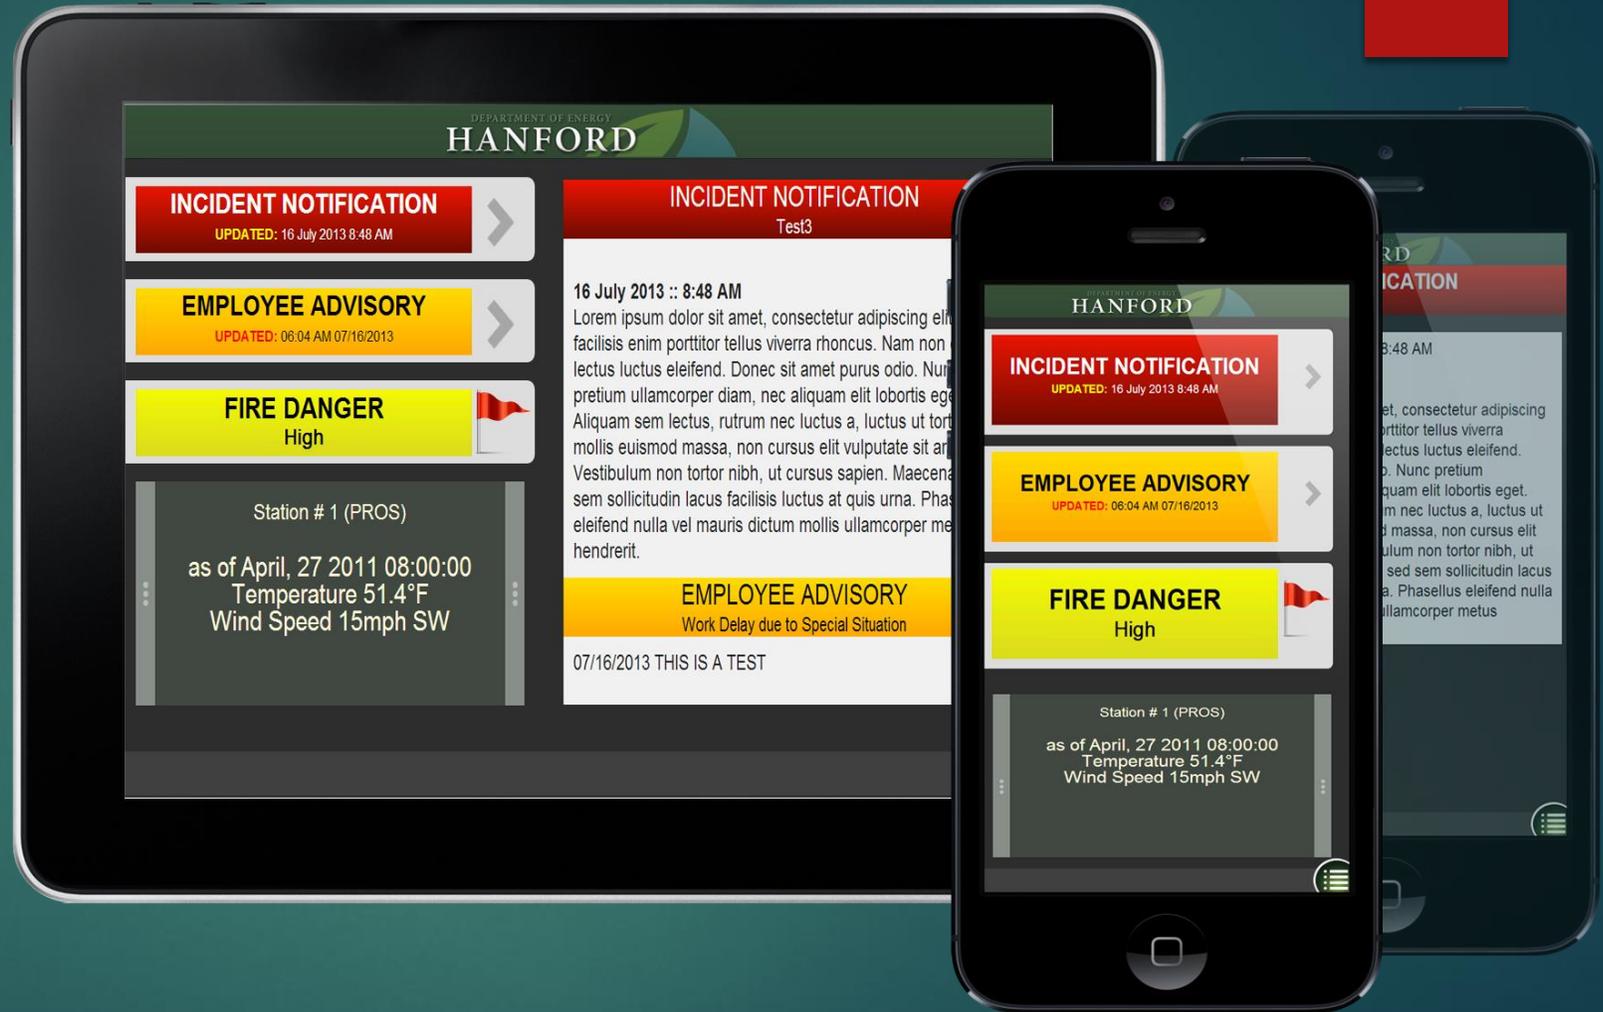

Assets in Place

- Existing data calls

- Tested and Reliable
- Test Server Environment

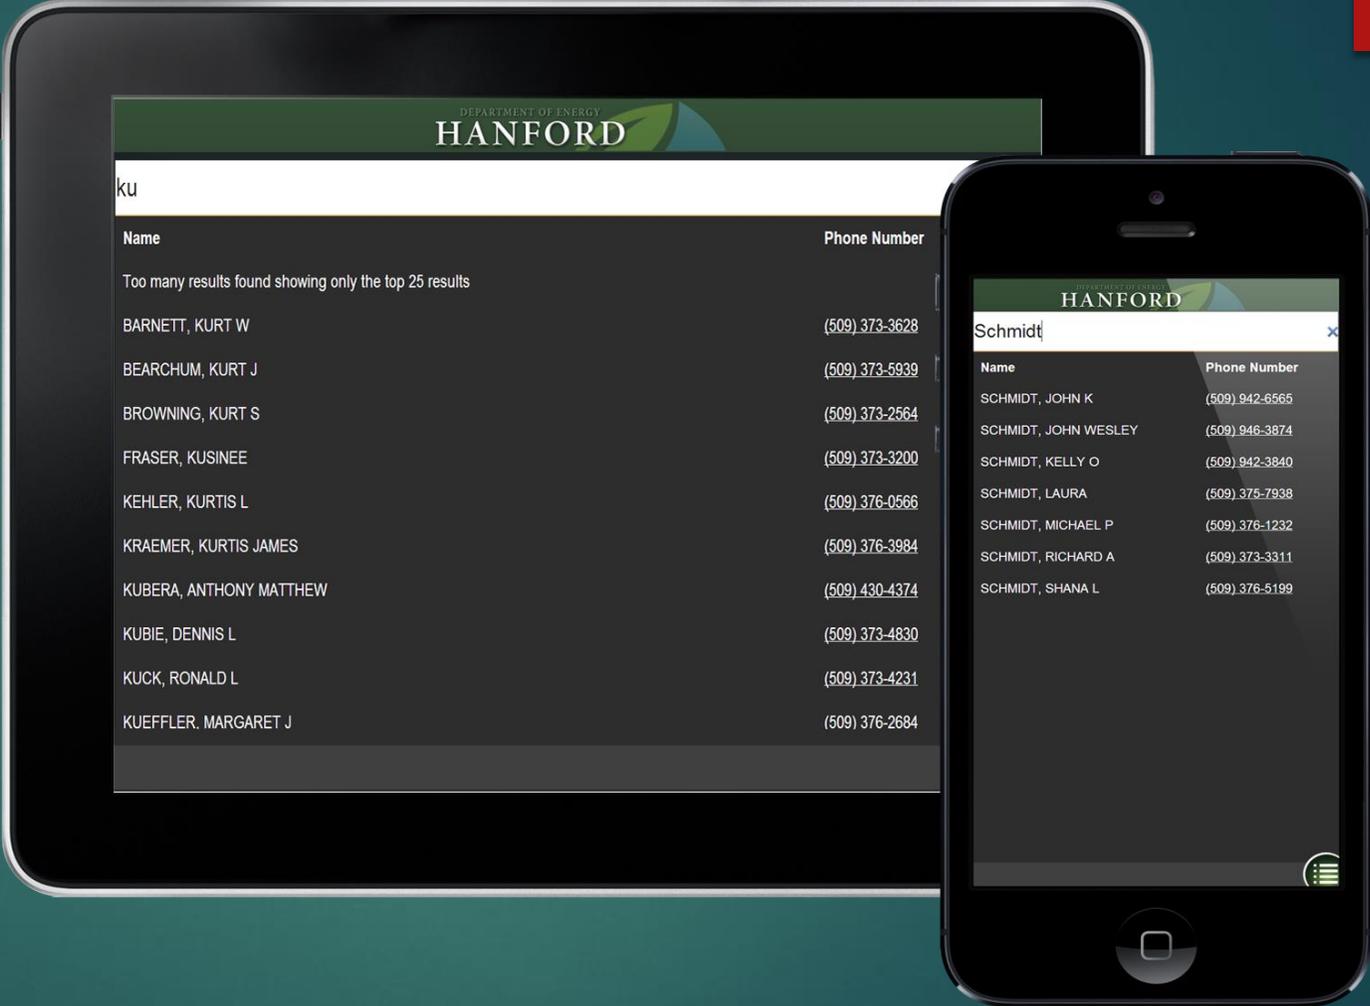

Common state
(no active alerts)
provides user with
current fire
danger level, red
flag warning and
user selected
weather
information.

During an alert (incident, exercise and/or advisory) the user will receive push notifications about the alert and the application will update with the latest information.

The Hanford Staff Directory is also available for searching and provides telephone numbers and touch calling functionality.

Under the settings page the user can change which notifications they receive, plus chose a weather location default from 32 individual reporting stations
